Urban Rainscapes!
By Laura Fay

There is nothing easy in retrofitting an urban environment, especially to mimic the natural hydrologic cycle by increasing infiltration, evapo-transpiration and reducing runoff from impervious edges and lacking deep-rooted vegetation. This situation encourages erosion that deposits nutrients and sediment in waterways and can harm stream life. Excess fertilizer nutrients can cause algae growth, harming stream life.

Don’t let the opportunity to improve urban rain gardens pass you by! Each community has different ordinances about downspout infiltration, evapo-transpiration and reducing runoff from impervious surfaces. In recent months, FLOW was educated about issues that might come to bear for urban restoration under our Olentangy Urban Rainscapes (OUR) project.

• Renters cannot apply for a rain barrel without the approval of the landlord. Columbus offers free rain barrels to some people that fit your schedule that will match your skills and interests.

In spite of everything we were lucky to work with Wagenbrenner Development, a developer who understands the need to do things differently. We had other great partners in Sandy Fey and Susan Weber at Integrity Sustainable Planning & Design. Franklin Soil & Water Conservation District helped the project by providing equipment and training. The amount of water being infiltrated in the newly installed rain gardens.

Adopt-a-Pond efforts will focus on outreach to pond landowners to help them make simple changes to improve the biology and water quality of local ponds.

• Eliminate the use of fertilizer and pesticides near your ponds.

This pond in the Olentangy Meadows development is mowed to prevent algae growth, harming stream life. Step mowing to the edge of the pond to create a vegetative buffer.

• Plant trees and native plants to encourage wildlife. Native plants prosper in central Ohio soils and provide food and shelter for birds and butterflies.

SUMMER 2014

Adopt Your Pond for a Cleaner Olentangy River

FLOW is launching a new Adopt-a-Pond initiative to educate landowners on the benefits of vegetative buffers and habitat improvements near ponds. FLOW identified hundreds of ponds in the Lower Olentangy watershed that could be converted from biologically sterile basins into water-quality assets to help protect our river. The initiative received help under a grant from the Vancouver-based cosmetics company LUSH, with shops at Easton and Polaris Malls. The LUSH Charity Pot Program uses the proceeds from a line of specialty Charity Pot moisturizers to fund efforts by grassroots organizations like FLOW to achieve their goals.

Adopt-a-Pond efforts will focus on outreach to pond landowners to help them make simple changes to improve the biology and water quality of local ponds.

• Eliminate the use of fertilizer and pesticides near your ponds.

This pond near Windsor Ave includes a vegetative buffer to trap nutrients and hold soil in place, reducing erosion and sediment build-up in the pond. Vegetation also helps keep water temperatures cool.

Big Spring Tree Planting at Ohio School for the Deaf

On Saturday, April 26, FLOW and partners hosted our Annual Big Spring Tree Planting at the Ohio School for the Deaf on Morse Road, on land adjacent to Bill Moose Run. Over 225 community volunteers turned out to plant more than 1,600 upright trees and installed deer guards on about 230 trees. Volunteer leaders included Battelle staff members and local garden and friends. FLOW, Franklin Soil & Water Conservation District, OSI, JP Morgan Chase, Half Price Books, NBBi, Anheuser Busch Columbus Brewery, CIST, The Tool Library, and Franklin Soil & Water Conservation District provided logistical support for the event as well as the planting site on a three-acre portion of their conservation easement at the School for the Deaf.

Despite a light rain early on the morning of the tree planting, volunteer turnout was the best we have seen in recent years, and before long the trees were planted in their new home. Thanks to all of the volunteers that came out to help, and to event sponsors like Green Columbus Earth Day 2014 website.

FLOW saw lots of old friends that morning as well as a number of new friends. We couldn’t do it without you!

Fifth Avenue Dam Removal – A New Beginning

The Fifth Avenue dam removal and river restoration are nearing completion. The banks of the river were rebuilt, wetlands constructed, and more than 4,000 trees, 17,000 live stakes, and about 1,000 shrubs have been planted between Lane and Fifth Avenues. The banks are covered with erosion control blankets, and dotted with newly planted saplings. Workers faced many challenges in implementing the project, including high water during the wet summer of 2013, hungry beavers pulling a tire from the restored waterway, and hundreds of Canada Geese gobbling up seeds.

River enthusiasts can finally see the greening of the riverbanks. Vegetation is the first step in stabilizing riverbanks and providing food and shelter for wildlife. Riverbanks and providing food and shelter for wildlife. Vegetation is the first step in stabilizing riverbanks and providing food and shelter for wildlife.

The change from dam pool to flowing river makes the river more hospitable to wildlife. Dam removal allows fish, freshwater mussels and other aquatic species to migrate up and down the river, connecting this free-flowing portion of the Olentangy to the Scioto River for the first time in nearly 80 years. Now our river and its naturalized setting are protected with a permanent conservation easement and it will flow uninterrupted from the Dodridge Street dam all the way to the confluence with the Scioto in downtown Columbus.

provided trees, Battelle staff that contribute to FLOW throughout the year and provided refreshments and lunch for volunteers. The Tool Library loaned us shovels and Franklin Soil and Water Conservation District provided logistical support for the event as well as the planting site on a three-acre portion of their conservation easement at the School for the Deaf.

FLOW calendar of events

More events are posted on FLOW’s web calendar at www.olentangywatershed.org. For more information, call the FLOW office at (614) 267-3386 or email us at info@olentangywatershed.org.

Stream Clean Up at Glen Echo Park
Sat. July 19 – 9am to noon
FLOW and Anheuser Busch are teaming up with River Network for a Stream Clean Up at Glen Echo Park. Volunteers are needed to help pick up litter, weed the butterfly garden and help with registration and picnic logistics. We’ll meet at the parking area at Calumet Christian School (2774 Calumet St., Columbus, OH 43202). Please RSVP to (614) 267-3386 or send us a message at info@olentangywatershed.org so we know how many will join us for the picnic!

Stream Quality Monitoring Training at High Banks Metro Park
Aug. 4 & 6 – 6:30pm
Join Ohio Department of Natural Resources staff to learn about stream quality monitoring and macro-invertebrates on Monday, August 4 and Wednesday, August 6 at 6:30pm. Meet at the Stream Side Classroom parking area.

Paddle in the City – Second Saturday Canoe Floats on the Olentangy Water Trail – July 12, Aug. 9, Sept. 13
FLOW is partnering with HERO USA to bring paddle sports to the Olentangy Trail on July 12, August 9, and September 13. Space is limited, so reserve your spot in a canoe or kayak at www.HEROUSA.org. This series of canoes and kayaks were made possible in part by a generous donation from outdoor outfitter REI and their new store at Easton.

Beechwold Park – corner of W Beechwold Blvd. and Rustic Bridge Rd.
July 26
Anheuser Busch Sports Park
Aug. 2
Glen Echo Park
Aug. 23
Whetstone Park
Sept. 13
Island View Park
Sept. 20
Kenney Park – behind LA Fitness at Graceland Shopping Center
Sept. 27
Clinton Como Park
Oct. 4

New Butterfly Gardens at Worthington Hills and Clinton Como Park

June planting dates helped bring butterfly gardens to life in two local parks. Funded by grants from the Columbus Chapter of the Little Garden Club and Monarch Watch, the gardens were planted in cooperation with Columbus Recreation and Parks and Columbus Metro Parks, with help from the Worthington Hills Garden Club and FLOW volunteers. Butterflies and other pollinators have experienced steep population declines in recent years, and it is hoped that these gardens will help provide habitat.

Butterfly garden volunteers helped bring beauty and pollinator habitat to two area parks.

Columbus does not have any incentives for residential property. Cutting curbs, to allow street water to flow into tree lawns, was not allowed for our Weinland Park project. Another lost opportunity to reduce stormwater overflows.

Each community has different ordinances about downspout management. Renters cannot apply for a rain barrel without the approval of the landowner. Columbus offers free rain barrels to some people that might come to bear for urban restoration under our Olentangy Infiltration, evapo-transpiration and reducing runoff from impervious surfaces. In recent months, FLOW was educated about issues that might come to bear for urban restoration under our Olentangy Urban Rainscapes (OUR) project:

- Renters cannot apply for a rain barrel without the approval of the landowner. Columbus offers free rain barrels to some people that participate in the Low Income Water and Sewer Discount Program, but you still need to access to a drill and about $20 to set up your barrel.
- Each community has different ordinances about downspout connection and rain barrels. One community in our watershed requires that rain barrels match the house color.
- Some communities don’t permit piping water under sidewalks that could be used to connect front yard rain gardens to tree lawns. This results in lost opportunities for infiltration.
- Cutting curbs, to allow street water to flow into tree lawns, was not allowed for our Weinland Park project. Another lost opportunity to reduce stormwater overflows.
- City planners want to increase density in the University District area to provide more student and faculty housing. With the increased density of people comes the increase in need for roads, sidewalks, parking spaces and potentially the loss of trees and green space.
- Columbus does not have any incentives for residential property owners to include green infrastructure like rain gardens or trees.

In spite of everything we were lucky to work with Wagenerbrenner Development, a developer who understands the need to do things differently. We had other great partners in Sandy Frey and Susan Weber at Integrity Sustainable Planning & Design. Franklin Soil & Water Conservation District helped the project by providing equipment to monitor the amount of water being infiltrated in the newly installed rain gardens. MAD Scientist and Associates collected and analyzed the rain-garden monitoring data, and Wendy Naumann installed rain gardens. MAD Scientist and Associates collected and analyzed the rain-garden monitoring data, and Wendy Naumann installed rain gardens. MAD Scientist and Associates collected and analyzed the rain-garden monitoring data, and Wendy Naumann installed rain gardens. Madison Avenue Northside Development Services (MAD Scientist) funded the MAD Scientists to improve the biology and water quality of local ponds:

- Eliminate the use of fertilizer and pesticides near their ponds.
- Excess fertilizer nutrients can cause algae growth, harming stream life.
- Step mowing to the edge of the pond to create a vegetative buffer. Buffers help hold soil in place and clean runoff water before it reaches their pond.
- Adopt-a-Pond efforts will focus on outreach to pond landowners to help them make simple changes to improve the biology and water quality of local ponds.

Adopt-a-Pond initiatives can provide superior environmental benefits by incorporating vegetative buffers that reduce sediments loads in streams and habitat for wildlife. If your homeowner association or commercial business park is interested in learning more about the Adopt-a-Pond initiative, please contact the FLOW office for more information.
